POLYMER BANKNOTE

FRONT

REVERSE

FEEL

LOOK

CHECK

Polymer notes feel smoother than paper.

Using an ultra-violet (UV) light and a magnifier:

1 Run your fingers over the bottom corner of the note to feel the two lines.

When you hold the note up to the light you will see:

2 A clear window that can be seen from the front and back of the note.

3 The numeral 1 appearing in the red coloured print.

4 If you look at the note under UV light you will see that some areas of the note glow.

5 If you look at the note under magnification, some areas that appear as plain print are in fact very small letters and numbers.
